

Mounting instruction – Down pipe Clamping Rings

(For down pipe clamping rings with diameter of 87mm, 100mm, 120mm, 150mm that are galvanized or powder coated, designed for rainwater systems)

ZPHU "Hak-Mar" guaranties its products to maintain top quality and its functional and aesthetic properties as long as the following mounting instructions are followed:

- T-25 Torx key or size 6 spanner or two 8mm nuts need to be used to screw double-ended bolt into the wall to the desired depth first and only then the clamping ring can be attached to the bolt
 - Clamping ring itself should not be used to screw double-ended bolt into the wall by holding and turning it
 - When using two 8mm nuts the first nut should be locked by the second one creating a lock, so that the double-ended bolt can be screwed into the wall by a spanner
- Down pipe clamping rings should not be fixed with gaps bigger than 200cm between them
- Down pipe clamping rings are designed to be used in normal environmental conditions *(products are not designed to be used on sites located in the areas of aggressive environmental conditions e.g. air with high levels of pollution or salt etc.)*
- Products cannot stay in prolonged contact with rusty objects, strong chemicals, or objects made of led
